

Using of 70 Volt Line in Voltage Matching:- If a Loudspeaker/Driver unit is adjusted to 15Watt tapping, when the connected to COM and 100V terminals on the Amplifier's terminal will draw entire 15Watt from the amplifier but when it is connected in COM and 70V terminal, it will draw 7.5 Watt only or half of the power. A good use of 70V line tap can be made in the installations where large number of speaker/driver units is to be installed for more even distribution of sound like installations at platforms.
